Support Compressed and Uncompressed RES, CPL and OCX (32 and 64-bit) resource format. Resource Tuner Console Beta Resource Tuner Console is currently in a testing stage. When the full release goes out, it will be

---

distributed as a freeware (depending on our evaluation). You can register at [sourceforge.net](http://sourceforge.net) to get the latest information about the upcoming release. Resource Tuner Console also has a web portal at [wikipedia.com](http://wikipedia.com) where beta testers can go for more information. You can even download the beta at SourceForge for testing purposes. Save time by automating resource changes

Decompress your EXE, RES, DLL, CPL, SCR, Borland library files and OCX controls, and tamper with different types of resources, be it the version number, logo, strings or the application's icon. Resource Tuner Console is the command line counterpart of Resource Tuner, specifically designed to provide developers with the means to automate resource editing operations after compiling. It

---

is not intended for resource viewing, but for quickly implementing changes into a project in the final development stage. Post-compilation resource editing Running in the command prompt, Resource Tuner Console is intended for experienced users. Just like the GUI edition, it works with both -bit portable executable files, such as EXE, RES, DLL, SCR, CPL, Borland library files

---

or OCX controls, enabling you to tamper with different types of resources, be it the version number, logo, strings or the application's icon. The advantage that the console edition brings relies in automation and batch processing. Resource Tuner Console can be embedded in a project and configured to automatically apply changes to a large number of files in case of version updates,

---

program rebranding (new icons, manifest files, bitmaps) or code protection. Automate resource editing in your projects In other words, Resource Tuner Console provides you with a quick means of tampering with resources of their project. Using it, you can create repetitive tasks to modify the version number of an application and other strings, such as the copyright

---

information or the product name, all without recompiling. Resource Tuner Console can also manage manifest files, replace icons and logos and tamper with pretty much any string. The downloadable package includes sample scripts that you can use to take Resource Tuner Console for a test and see if it fits your needs. [3a67dffeec](#)

---

Tuning = Performance Tuning  
Resource Tuner Console  
provides a built-in tuning  
system that allows you to  
view and set the program's  
tuning level on the fly. By  
analyzing each resource in the  
program, Resource Tuner  
Console creates a tuning  
schedule for the functions in  
the application. The overall  
architecture of Resource  
Tuner Console is based on the  
simple idea of tuning as being

---

a set of adjustments that can be made to improve the program's operation. Resource Tuner Console provides you with a number of tools that make use of this concept. One of the most notable features of Resource Tuner Console is its automatic tuning functionality. For instance, if you need to enhance the application's resource file, you can use Resource Tuner Console to set

---

the version number and modify the rest of the file without the need to recompile. But Resource Tuner Console does not stop there. The tuning schedule is dynamic and can change depending on the parameters of the application, such as input size or output size. The automatic tuning process is also capable of saving a tuned version of the application and launching it whenever

---

required. As a result, Resource Tuner Console provides you with a lightweight and practical solution for tuning the various settings of your compiled application.

Resources can be any files, such as file text, binary data, images, resource templates, resource files or macros. By using these resources, you
